

Field Study Fun

Setting Up a Field Study Plot

1. Research ahead of time to determine which plants species attract the most wildlife in your area. Whenever possible, use native species which are adapted to local weather conditions and are often attractive to wildlife. You might also select a plant that grows and/or changes quickly to maintain student interest while conducting the field study. Ask for advice at a local nature center or garden center. Suitable plants may already exist in your school's landscape or be readily available at a local nursery.
2. Once you have selected a suitable plant species, find a group of plants of that species in your landscape or plan a space in which to plant them. Rope off a square yard or suitable sized area around the plants (children may be involved in this process) to serve as your study plot. You may have one study plot and work with one small group at a time or several similar study plots that small groups can observe at the same time. With older children, you may have plots with different types of plants for a comparison study. If space is an issue, consider using container plants (see below). In many regions, spring is a good time of year to start the study.

Container Gardens

If it is desired or necessary for you to plant your own seeds, seedlings or plants in order for your students to conduct a successful field study, there are a variety of container garden options that may suit your needs. In general, containers that have rims close to the ground will allow more ground dwelling animals to visit your field study plot. Larger containers with more soil generally require less frequent watering and are less susceptible to temperature extremes—but they may be much heavier to carry if you need to bring them indoors.

Basic steps for creating a container garden are as follows:

1. Select a container such as a clay pot or planter box that is large enough for your plants at their expected size at maturity.
2. Cover the bottom of the container with small rocks. Then cover the rocks with a thick layer of potting soil.
3. Plant seeds, seedlings, or plants in the soil according to package or label directions. Check your garden every day and water as needed.
4. If you feel it is necessary, you may opt to carry your container garden indoors each evening (to protect it from vandals or large herbivores, for instance), but realize that doing so may disrupt some natural cycles of the plant or animals that use it and will bring bugs inside.
